Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims presented in the above-identified application:

- 1. (currently amended) A system for assaying one or more targets in a sample, comprising:
- (a) an assay device having one or more assay sets at least one for each target to be assayed, each of the assay sets comprising at least two electrodes and a recognition moiety immobilized to one or more of the at least two electrodes, the recognition moiety being capable of specific binding to a component of one of the targets selected from the group consisting of a bacterium, a virus, and a cell;
- (b) an electric or electronic module arranged and configured to measure electric conductance between the at least two electrodes of each assay set; and
- (c) reagents formulated to deposit a conductive substance onto a complex formed between said recognition moiety and said target, wherein the reagents comprise: (i) a solution comprising nucleation-center forming entities for binding to said target if said target is present in the sample; and (ii) a combination of metal ions and a reducing agent to allow formation of said conductive substance on said entities, and wherein the conductive substance, when deposited onto the complex, forms a conductive bridge between the at least two of the electrodes of a set.

- 3. (previously presented) A system according to Claim 1, wherein said reagents comprise:
- (i) one or more reagents to allow deposition and/or formation of said nucleation center-forming entities on a complex formed between said recognition moiety and said target;
- (ii) a combination of metal ions and a reducing agent to allow formation of said conductive substance from said entities.

- 4. (previously presented) A system according to Claim 1, wherein said nucleation-center forming entities are colloid particles.
- 5. (previously presented) A system according to Claim 1, wherein said nucleation-center forming entities are metal complexes, clusters, or complexes and clusters.
- 6. (original) A system according to Claim 4, wherein said colloid particles are colloid gold particles.
- 7. (previously presented) A system according to Claim 5, wherein said metal complexes or clusters are gold complexes or gold clusters.
- 8. (original) A system according to Claim 4, wherein said colloid particles are colloid platinum particles.
- 9. (previously presented) A system according to Claim 5, wherein said metal complexes or clusters are platinum complexes or platinum clusters.

10.-17. (canceled)

- 18. (previously presented) A system according to Claim 1, comprising a plurality of assay sets of electrodes.
- 19. (original) A system according to Claim 18, wherein all assay sets of electrodes are for assaying the same target.
- 20. (original) A system according to Claim 18, wherein different assay sets of electrodes or different groups of assay sets are for assaying different targets.
- 21. (original) A system according to Claim 20, for simultaneous determination at different targets in a sample.

- 22. (previously presented) A system according to Claim 1, when the target is a protein or polypeptide and the recognition moiety is a protein-binding molecule which specifically binds to the target protein.
- 23. (original) A system according to Claim 22, wherein said recognition moiety is an antibody or antibody fraction comprising at least the antigen-binding domain of the antibody.
- 24. (currently amended) A method for assaying one or more <u>biological molecule</u> targets in a sample comprising:
- (a) providing an assay device having one or more assay sets at least one for each target to be assayed, each of the assay sets comprising at least two electrodes and a recognition moiety immobilized to one or more of the at least two electrodes, the recognition moiety being capable of specific binding to one of the targets;
- (b) contacting said assay device with said sample under conditions permitting binding of targets to specific recognition moieties to form a complex;
- (c) contacting said assay device with reagents to deposit a conductive substance onto the complex formed between said recognition moiety and said target, such that the conductive substance deposits onto the complex and forms a conductive bridge between said at least two electrodes;
- (d) connecting said at least two electrodes to an electric or electronic module to measure conductance between said at least two electrodes; and
- (e) determining conductance between said at least two electrodes, conductance above a threshold conductance indicating the presence of a respective target in the sample.
- 25. (currently amended) A method for assaying one or more <u>biological molecule</u> targets in a sample, comprising;
- (a) reacting the sample targets with a first reagent solution to bind nucleation center-forming entities to said targets;
- (b) providing an assay device having one or more assay sets at least one for each target to be assayed, each of the assay sets comprising at least two electrodes and a

recognition moiety immobilized to one or more of the at least two electrodes, the recognition moiety being capable of specific binding to one of the targets;

- (c) contacting said assay device with said sample under conditions permitting binding of targets to specific recognition moieties;
- (d) contacting said device with a second reagent solution to form a conducting metal substance over said nucleation center-forming entities for a time sufficient to yield a conductive bridge between said at least two electrodes;
- (e) connecting said at least two electrodes to an electric or electronic module to measure conductance between said at least two electrodes; and
- (f) determining conductance between said at least two electrodes, conductance above a threshold conductance indicating the presence of a respective target in the sample.
- 26. (currently amended) A method for assaying one or more <u>biological molecule</u> targets in a sample, comprising:
- (a) providing an assay device having one or more assay sets at least one for each target to be assayed, each of the assay sets comprising at least two electrodes and a recognition moiety immobilized to one or more of the at least two electrodes, the recognition moiety being capable of specific binding to one of the targets;
- (b) contacting said assay device with said sample under conditions permitting binding of targets to specific recognition moieties;
- (c) contacting said device with a first reagent solution comprising monomers of a conductive polymer such that said monomers can bind to complexes formed between the targets and recognition moieties;
- (d) treating said device such that said monomers will polymerize to form a conducting polymer, such that upon polymerization of the monomers a conductive bridge between the at least two electrodes of at least one set is formed; and
- (e) determining a conductance between said at least two electrodes, conductance above a threshold conductance indicating the presence of a respective target in the sample.
- 27. (previously presented) A method according to Claim 26, comprising before step (a) reacting the sample with a second reagent solution containing entities which can form

nucleation centers for growing therefrom a conductive polymer from said monomers, such that said entities bind to said targets if present in the sample.

- 28. (previously presented) A method according to Claim 26, comprising after step (a) contacting said assay device with a second reagent solution containing entities which can form nucleation centers for growing therefrom a conductive polymer from said monomers, such that said entities bind to said targets if bound to said recognition moieties.
- 29. (currently amended) A method according to Claim 24, wherein said targets are nucleic acid sequences molecules and the recognition moieties are oligonucleotides, each of which has a sequence which is complementary to one of the sequences a nucleic acid molecule of said targets target.

30. (canceled)

- 31. (currently amended) A kit for use in assaying one or more targets in a sample, comprising:
- (a) an assay device having one or more assay sets at least one for each target to be assayed, each of the assay sets comprising at least two electrodes and a recognition moiety immobilized to one or more of the at least two electrodes, the recognition moiety being capable of specific binding to a component of one of the targets selected from the group consisting of a bacterium, a virus, and a cell; and
- (b) reagents formulated to deposit a conductive substance onto a complex formed between said recognition moiety and said target, wherein the reagents comprise: (i) a solution comprising nucleation-center forming entities for binding to said target if said target is present in the sample; and (ii) a combination of metal ions and a reducing agent to allow formation of said conductive substance on said entities, and wherein the conductive substance, when deposited onto the complex, forms a conductive bridge between the at least two of the electrodes of a set.

- 33. (previously presented) A kit according to Claim 31, where said reagents comprise:
- (i) one or more reagents to allow deposition, formation, or deposition and formation of said nucleation-center forming entities on a complex formed between said recognition moiety and said target; and
- (ii) a combination of metal ions and a reducing agent to allow growth of said conductive substance on said entities.

34. (canceled)

35. (currently amended) An electronic device for determining one or more targets in a sample, comprising:

an integrated circuit comprising a first group of N_1 conductors and a second group of N_2 conductors, defining between them N_1xN_2 junctions, each such junction being formed with an electronic module comprising two electrodes, each one linked to or defined as an integral portion of one of the conductors, and comprises a diode or non-linear component permitting current flow through the electronic module only in the direction from the first group of conductors to the second group of conductors whereby a current flowing between one conductor of the first group to one conductor of the second group of conductors defines a single junction point between them; each pair of electrodes forming part of an assay set, each assay set having a recognition moiety for binding to a component of a target selected from the group consisting of a bacterium, a virus, and a cell, bound to at least one of the electrodes and reagents formulated to deposit a conductive substance onto a complex formed between said recognition moiety and said target, wherein said reagents comprise: (i) a solution comprising nucleation-center forming entities for binding to said target if said target is present in the sample; and (ii) a combination of metal ions and a reducing agent to allow formation of said conductive substance on said entities.

36. (previously presented) A device according to Claim 35, wherein distance of center of one assay set to a center of an adjacent assay set is $100 \mu m$ or less.

37. (currently amended) An electric device for determining one or more targets in a sample comprising:

a microelectronic device having a plurality of layers, with a first group of conductors being defined as stripes in one or more first layers and a second group of conductors being defined as stripes in one or more second layers of the device with each of said second layers being separated from a first layer by a non-conductive substance, electrodes of the device being formed as open ends of the conductors by openings or cut-outs in a vertical direction through the layers;

each pair of electrodes forming part of an assay set, each assay set having a recognition moiety for binding to a component of a target selected from the group consisting of a bacterium, a virus, and a cell bound to at least one of the electrodes and reagents formulated to deposit a conductive substance onto a complex formed between said recognition moiety and said target, wherein said reagents comprise: (i) a solution comprising nucleation-center forming entities for binding to said target if said target is present in the sample; and (ii) a combination of metal ions and a reducing agent to allow formation of said conductive substance on said entities.

38. (previously presented) A system according to Claim 18, wherein the device is an electronic device for determining one or more targets in a sample, comprising:

an integrated circuit comprising the first group of N_1 conductors and a second group of N_2 conductors, defining between them the N_1xN_2 junctions, each such junction being formed with an electronic module comprising two electrodes, each one linked to or defined as an integral portion of one of the conductors, and comprises a diode or non-linear component permitting current flow through the electronic module only in the direction from the first group of conductors to the second group of conductors, whereby a current flowing between one conductor of the first group to the one conductor of the second group of conductors defines a single junction point between them; each pair of electrodes forming part of an array set, each array set having a recognition moiety bound to at least one of the electrodes.

39. (previously presented) A method according to Claim 24, wherein said device is an electronic device for determining one or more targets in a sample, comprising:

an integrated circuit comprising the first group of N_1 conductors and a second group of N_2 conductors, defining between them $N_1 \times N_2$ junctions, each such junction being formed with an electronic module comprising two electrodes, each one linked to or defined as an integral portion of one of the conductors, and comprises a diode or non-linear component permitting current flow through the electronic module only in the direction from the first group of conductors to the second group of conductors, whereby a current flowing between one conductor of the first group to one conductor of the second group of conductors defines a single junction point between them; each pair of electrodes forming part of an array set, each array set having a recognition moiety bound to at least one of the electrodes.

- 41. (original) A method for detecting one or more targets in a sample by multiplexing comprising:
- (i) contacting the electronic device of Claim 35 with the sample under conditions enabling binding of the targets to recognition moieties; and
 - (ii) determining conductance in each assay set.
 - 42. (canceled)
- 43. (previously presented) A system according to Claim 1, wherein said one or more targets are one or more nucleic acid sequences.
- 44. (previously presented) A system according to Claim 43, wherein said recognition moiety is an oligonucleotide having a sequence complementary to at least a portion of sequence of one of said one or more targets.
- 45. (previously presented) A method according to claim 24, further comprising contacting said assay device with a first reagent solution to form nucleation-center forming entities for depositing onto or binding to complexes formed between a target and a recognition moiety.

- 47. (new) A method according to Claim 25, wherein said targets are nucleic acid molecules and the recognition moieties are oligonucleotides, each of which has a sequence which is complementary to a nucleic acid molecule of said target.
- 48. (new) A method according to Claim 26, wherein said targets are nucleic acid molecules and the recognition moieties are oligonucleotides, each of which has a sequence which is complementary to a nucleic acid molecule of said target.
- 49. (new) A method according to Claim 24, wherein said targets are selected from the group consisting of a bacterium component, a virus component, and a cell component.
- 50. (new) A method according to Claim 25, wherein said targets are selected from the group consisting of a bacterium component, a virus component, and a cell component.
- 51. (new) A method according to Claim 26, wherein said targets are selected from the group consisting of a bacterium component, a virus component, and a cell component.
- 52. (new) A kit according to Claim 31, wherein said recognition moiety is a nucleic acid molecule.
- 53. (new) An electronic device according to Claim 35, wherein said recognition moiety is a nucleic acid molecule.
- 54. (new) An electric device according to Claim 37, wherein said recognition moiety is a nucleic acid molecule.
